

LAB 2

- 1- Given the string, check if it is a palindrome.

Example

For inputString = "aabaa", the output should be solution(inputString) = true;

For inputString = "abac", the output should be solution(inputString) = false;

For inputString = "a", the output should be solution(inputString) = true.

- 2- Given two lists lst1 and lst2, your task is to return a list formed by the elements of lst1 followed by the elements of lst2
- 3- Convert a list of names into sorted dictionary which key is the Alpha. and value is a list of names corresponding to this alpha.
- 4- Ask the user for his name then confirm that he has entered his name (not an empty string/integers).then proceed to ask him for his email and print all this data
(Bonus) check if it is a valid email or not
